Now let’s design menu.jsx we will let's design an pop up window that open in the midle of the screen when we click on add to bag or create your own button there will be few diffrent pop up window in these cases: if we click on add to bag, 1- if we are adding 🍟 APPETIZERS & SIDES , 🥤 BEVERAGES & CHILL FREEZES and 🍩 SWEET DESSERTS, then it should not open any pop up windows and should add directly to cart and they should reflect the no on items already present

in cart with +2- style only for this 3 catagory. 2- if we click create your won taco then it should

📜 Master E-Commerce System Rules Manifest

🏷️ SECTION 1: Product Classification & The popup Flag

Every menu item streaming from the database contains a conditional property flag that determines its frontend entry point:

- **popup = 0 (Frictionless Direct-Add Categories):**
    - **Target Categories:** 🍿 APPETIZERS & SIDES, 🥤 BEVERAGES & CHILL FREEZES, and 🍩 SWEET DESSERTS.
    - **Behavior:** Clicking "Add to Bag", +, or - **never** opens any popup overlay windows. It bypasses customizers and commits changes straight to the database.
- **popup = 1 (Customizable Categories):**
    - **Target Categories:** All Mains, Combo Boxes, and "Make Your Own" custom builders.
    - **Behavior:** Always triggers the specialized multi-part popup window based on the routing rules in Section 2.

🗺️ SECTION 2: Pop-Up Menu Section Layout & Conditional Routing

The Customizer Overlay is split into **4 independent structural parts**:

- **Part 1 (Size Selector):** Pinned at the absolute top of the form view canvas (Small [1.0x], Regular [1.2x], Large [1.5x]).
- **Part 2 (Mains Pantry Matrix):** Contains Base Shell increment wheels alongside individual item single-allowance lists (🌱 Proteins, 🧀 Cheeses, 🌶️ Sauces, 🍅 Salsas, 🥬 Toppings).
- **Part 3 (Meal Bundle Companions):** Dedicated combo selection tracks matching the exact uppercase headers: 🍿 APPETIZERS & SIDES, 🥤 BEVERAGES & CHILL FREEZES, and 🍩 SWEET DESSERTS.
- **Part 4 (📦 SideAndExtra):** Pinned at the bottom of the scroll container to add extra spice sauce packets.

🔀 Button Entry Target Routing Rules:

1. **Full Customizer View (Opens Parts 1, 2, 3, and 4):**

- **Triggers:** Clicking any item inside 🥤 BIG BELL VALUE MEAL BOXES or hitting the 🛠️ CREATE YOUR OWN MEAL builder card.

2. **Core Taco Customizer View (Opens Parts 1, 2, and 4 Only - Part 3 Hidden):**
   - **Triggers:** Clicking items inside 🌟 MULTI-SHELL MIX & MATCH COMBOS, 🌯 LARGE TORTILLA BURRITOS, 🍟 CORN TORTILLA CHIPS BOXES, 🌮 SOFT SHELL TACO SELECTION, ⚡ CRUNCHY HARD SHELL SELECTION, or hitting the 🛠️ CREATE YOUR OWN TACO builder card.

🐚 SECTION 3: Base Shell Mutual-Exclusion & Capacity Rules

Base shells within Part 2 are governed by a strict group validation check:

- **Group A (Standard Taco Shells):** SH_01 through SH_06 (Crispy Corn, Soft Flour, Doritos, etc.). Customers can mix-and-match items across this collection up to an aggregated limit of **exactly 3 shells maximum combined**.
- **Group B (Chips Boxes):** SH_07 and SH_08 (Standard Box, Peri-Peri Box). Customers can choose **exactly 1 chips box maximum**.
- **Mutual Exclusivity Lock:** Adding *any* shell from Group A instantly disables the + buttons for Group B. Adding *any* box from Group B completely locks out Group A, preventing cross-contamination of menu styles.

🥗 SECTION 4: Individual Ingredient Allowance & Interaction Morphs

- **Strict Ceiling Cap:** Across your 34+ custom pantry ingredients (🌱 Proteins, 🧀 Cheeses, 🌶️ Sauces, 🍅 Salsas, and 🥦 Toppings), every distinct available row item has a hard limit of **exactly 1 maximum selection per individual item**.
- **Rule 6 Interaction State Morphs:** Ingredients start as a standard + Select action label. The exact second a count goes up to 1, the element morphs into an inline [-] 1 [+] button badge. The + button locks immediately (disabled={count >= 1}), forcing the user to drop the current selection back to 0 before they can pick another option.

📦 SECTION 5: Universal "SideAndExtra" Packet Limit

- The 📦 EXTRA SAUCE PACKETS ACCELERATOR track must render at the bottom of **every single pop-up menu path option** (Parts 1, 2, 4 and Parts 1, 2, 3, 4).
- Packets increment via inline +1/- counters and are bound by a combined structural limit of **5 maximum packet entries total per menu item container**.

🔢 SECTION 6: Cart Table Retention & Zero-State Rule Management

- **In-Card Counters (For popup = 0 Categories):** Card components map onto an inline + 1 - tracking badge. It displays the quantity from your Cart table rows. If dropped to 0, the row deletes from MongoDB, but the badge frame stays on screen so users can easily re-add items.
- **Database Cart Spreadsheet Retention (Table 14):** Items added to the basket table support a **0 quantity state**. Users can decrement an item's count down to 0 inside the main Cart screen. The row turns into a faded dashed placeholder box but **does not disappear from the page** until the user clicks the explicit ⚔ Delete Config From Bag button.

📝 SECTION 7: Permanent Orders Transactional Transfer Matrix

- **OrderItem Non-Zero Constraint:** While the active cart table permits 0 quantity rows, the permanent checkout logs table (**Table 16 - OrderItem**) strictly forbids them.
- **The Transactional Checkout Gate:** Clicking the "Secure Checkout" button triggers a backend transfer matrix. It automatically filters out any rows sitting at 0 quantity, registers the non-zero rows inside the immutable **OrderItem Table** with a strict min: 1 constraint, creates a tracking receipt summary inside the **Order Table (Table 15)**, and resets the user's cart table rows to a clean slate.

🧱 SECTION 8: Portion Size Multiplier Hierarchies & Price Compound Formulas

- **The Standalone Immunity Rule:** Portion sizing multipliers (Small: 1.0, Regular: 1.2, Large: 1.5) have **absolutely zero effect** on items or combo companions belonging to your three direct-add categories (🍟 , 🥤 , 🍩). Their pricing remains entirely locked at flat base rates.
- **Individual Item Multiplication First:** Sizing multipliers multiply the individual pricing of each chosen shell and ingredient *first*, before compounding them into the aggregated sum.
- **The Complete Pricing Math Formula:** $\text{Total\ Price}=\text{Round}\left(\left[\sum (\text{Shell\ Price}\times \text{Qty})+\sum (\text{Ingredient\ Price})\right]\times \text{Multiplier}\right)+\sum (\text{Fixed\ Companion\ Price})-\text{Round}(\text{Benefit}\times \text{Multiplier})$

🔭 SECTION 9: Rule 7 Absolute Backend-First Mutation Gating

- **No Frontend Guesses:** The frontend code never guesses prices, predicts totals, or creates local mock values.
- **Isolating Cart Writes:** Every single button action on the menu or cart page maps directly to an active background API network request updating **Table 14 (Cart Table) only**. The browser waits for a successful MongoDB write confirmation before executing a background re-fetch callback to paint the validated database values onto your screen components.

Rule 1: Activation Trigger Mapping & Target Context Identification

- Clicking an active card's selection trigger invokes the native HTML popovertarget="options" layout handler.
- This instantly injects that specific food product record into the activeItem state context. This allows your popup headers, calculations, and tables to reference the exact object data before rendering content frames.

Rule 2: Asynchronous Object Safety Gating

- To completely eliminate blank white page crashes during initial render states, no parameter lookups are permitted to directly access object attributes.
- All values inside the popover use **Optional Chaining (?.)** alongside short-circuit fallbacks (|| 0 or || "") to ensure the rendering engine stays completely crash-proof while waiting for the background database response.

Rule 3: Top-Pinned Sizing Layout Hierarchy

- The Portion Sizing selection matrix (Small, Regular, Large) remains locked at the absolute top of the scrolling popover content viewport canvas. This gives the customer instant portion sizing control before they navigate to lower ingredient blocks.

Rule 4: Multiplier Pricing Isolation

- Portion multipliers (1.0x, 1.2x, 1.5x) apply directly to the main recipe elements (base shells and custom ingredients).
- They have **absolutely zero effect** on attached appetisers, drinks, or dessert combo companions. The companion costs remain completely flat and immune to portion scaling factors.

Rule 5: Absolute State Reset on Popover Closure

- Clicking **"✕ Close"** or tapping outside the window boundaries triggers the resetModalStates() callback function. This clears out all recipe counters, checkboxes, and portion multipliers, resetting them to their blank defaults. This prevents prior choices from bleeding into different food item cards when a user opens them.

- **Rule 6: 👑 Dynamic Recipe Pre-selection (New Rule)**
  - The exact second the popover initializes via a card click event, the engine loops through that item's **linked_ingredients database array column** (e.g., ["SH_05", "SH_04", "CH_04", "PR_02", ...]).
  - It parses the IDs into their respective categories:
    - **Shell IDs** (prefixed with SH_): Automatically pre-selects and increments their individual counts inside the selectedShells map.
    - **Pantry Ingredient IDs** (prefixed with PR_, CH_, SC_, SL_, TP_): Automatically pre-selects them into the selectedIngredients dictionary, setting their active counters to 1 max.

```
